

# Percentage Delay Rate: QuickPay (2009-2012)

Aug 05, 2022

## 1 Delay days over time

## 2 Delay days over time (de-meanned)

## 3 Percentage delays over time

- Sample restricted to projects for which start dates matches the one in API
  - This is done by using first reported “action\_date” and “date\_signed”
- $PercentDelay_{it} = 100 \times Delay_{it} / Duration_{i,t-1}$ 
  - $Duration_{i,t-1} = Deadline_{i,t-1} - StartDate_i$

#### 4 Demeaned delay rate (in percentage)

- Subtract the average pre-quickpay delay rate from each observation

#### 4.1 Normalized delay rate (in percentage)

### 5 Baseline Regressions

$$PercentDelay_{it} = \beta_0 + \beta_1 Treat_i + \beta_2 Post_t + \beta_3 (Treat_i \times Post_t) + e_{it}$$

$$PercentDelay_{it} = \alpha + \beta_0 Treat_i + \beta_1 Post_t + \beta_2 (Treat_i \times Post_t) + X_i + (Post_t \times X_i) + \mu_t + \theta_{firm} + \lambda_{task} + \epsilon_{it}$$

Each observation is a contractor-quarter.

SEs are robust and clustered at the contractor level.

Sample restricted to contractors performing only one type of project.

## 11 Project portfolio: Spillover effect

### 11.1 Regression 1: DID on large projects

- Sample restricted to large projects only.
- $Treat$  is an indicator that equals one for LARGE projects that have at least one parallel small project in the same quarter, and is zero otherwise.

SEs are robust and clustered at the project level.

Sample restricted to large projects only.

## 11.2 Regression 2

- Treat equals one for small projects with at least one large project in the same quarter.
- Treat is zero for large projects with NO small project in the same quarter.
- Treat is not defined for other cases i.e, only small projects or large projects with small projects are excluded.

## 17.2 Impact on delays

Define

$$SA_i = \begin{cases} 1, & \text{if project was signed after QuickPay} \\ 0, & \text{otherwise} \end{cases}$$

$$SB_i = \begin{cases} 1, & \text{if project was signed before QuickPay} \\ 0, & \text{otherwise} \end{cases}$$

### 17.2.1 Subsample model

For a subsample of competitive or noncompetitive projects:

$$\begin{aligned} PercentDelay_{it} = & \beta_0 + \beta_1 Treat_i + \beta_2 SA_i + \beta_3 Post_t \\ & + \beta_4 (Treat_i \times Post_t \times SA_i) + \beta_5 (Treat_i \times Post_t \times SB_i) + e_{it} \end{aligned}$$

- According to our hypothesis,  $\beta_4$  should be positive and significant for competitive projects, and insignificant for non-competitive projects.
- In the following regressions, we also control for the project's age. Project's age is defined as the number of quarters since it first showed up in the sample. We include the terciles of project's age as a control variable.

### 17.2.2.1 Restricted Sample: One type

### 17.2.3 Four-way interaction

We run the following model:

$$\begin{aligned}
PercentDelay_{it} = & \beta_0 + \beta_1 Treat_i + \beta_2 StartedAfterQP_i + \beta_3 Post_t + \beta_4 Competitive_i \\
& + \beta_5 (Treat_i \times Competitive_i) + \beta_6 (Post_t \times Competitive_i) \\
& + \beta_7 (StartedAfterQP_i \times Competitive_i) + \beta_8 (Treat_i \times Post_t) \\
& + \beta_9 (Treat_i \times Post_t \times Competitive_i) \\
& + \beta_{10} (Treat_i \times Post_t \times StartedAfterQP_i) \\
& + \beta_{11} (Treat_i \times Post_t \times StartedAfterQP_i \times Competitive_i) + e_{it}
\end{aligned}$$

#### Interpretation:

- $\beta_9$  is the difference between treatment effect for competitive and non-competitive projects signed before quickpay.
- $\beta_9 + \beta_{11}$  is the difference between treatment effect for competitive and non-competitive projects signed after quickpay.

- $\beta_{11}$  is our coefficient of interest because it tells us how much of the difference is there due to “aggressive bidding” after the policy.

Each observation is a project-quarter.

SEs are robust and clustered at the project level.

Sample restricted to contractors holding only one type of project.
