

# First Implementation of QuickPay (2009-2012)

Mar 14, 2021

## 1 Delays over Time

## 2 Notation

- Project  $i$ , Year-Quarter  $t$
- $X_i$  denotes project level controls: initial duration, initial budget, number of offers received
- $\mu_t, \theta_{firm}, \lambda_{task}$ : Year-Quarter, Firm, and Product/Service code Fixed effects
- All continuous variables are winsorized at the 5% level

$$Treat_i = \begin{cases} 1, & \text{if project } i \text{ is a small business} \\ 0, & \text{otherwise} \end{cases}$$

$$Post_t = \begin{cases} 1, & \text{if year-quarter } t > \text{April 27, 2011} \\ 0, & \text{otherwise} \end{cases}$$

### 3 Parallel Trends Test

Let  $Time$  denote  $q$ -th quarter since the beginning of time horizon. For  $Post_t = 0$ , we run the following regression:

$$Delay_{it} = \alpha + \beta_0 Treat_i + \beta_1 (Treat_i \times Time) + \beta_2 X_i + \mu_t + \theta_{firm} + \lambda_{task} + \epsilon_{it}$$

The coefficient of interest is  $\beta_1$ . If this is significant, we would find evidence of a linear time trend before quickpay implementation – violating the parallel trends assumption.

## 8 Firm's rank order

- Consider a project  $i$  of firm  $f$  in quarter  $t$ .
- Let  $\Pi_{f,2010}$  denote all projects of firm  $f$  in Fiscal Year 2010.
- Define  $\rho_f = \sum_{i \in \Pi_{f,2010}} (Treat_i \times FAO_{if}) / Sales_{f,2010}$ .
- $\rho_f$  is the fraction of revenue a firm earned from small government projects in Fiscal Year 2010.
- Let  $Rank_f = r(\rho_f) / N$  where  $r(\rho_f)$  is the rank statistic of  $\rho_f$  and  $N$  = number of firms. For example,  $r(\rho_f) = 1$  if  $\rho_f = \min(\rho_1, \rho_2, \dots, \rho_N)$ .
- Put simply,  $Rank_f$  is a firm's rank order based on the fraction of revenue it earned from small government projects in FY 2010.

### 8.1 Portfolio Effects: Discrete

- See Jie's notes for details.
- Let  $Rank_f^{(k)}$  be an indicator for firm being in the  $k$ -th tercile of  $Rank$ . Define:

- $Medium_i = Treat_i * Rank_f^{(2)}$
- $High_i = Treat_i * Rank_f^{(3)}$

$$Delay_{it} = \beta_0 + \beta_1 Treat_i + \beta_2 Medium_i + \beta_3 High_i + \beta_4 Post_t + \beta_5 (Treat_i \times Post_t) + \beta_6 (Medium_i \times Post_t) + \beta_7 (High_i \times Post_t) + \epsilon_{it}$$
