# First Implementation of QuickPay (2009-2012)

Mar 21, 2021

# 1 Delays over Time

## 2 Notation

- Project i, Year-Quarter t
- $X_i$  denotes project level controls: initial duration, initial budget, number of offers received
- $\mu_t, \theta_{firm}, \lambda_{task}$ : Year-Quarter, Firm, and Product/Service code Fixed effects
- All continuous variables are winsorized at the 5% level

$$Treat_i = \begin{cases} 1, & \text{if project } i \text{ is a small business} \\ 0, & \text{otherwise} \end{cases}$$

$$Post_t = \begin{cases} 1, & \text{if year-quarter } t > \text{ April 27, 2011} \\ 0, & \text{otherwise} \end{cases}$$

## 3 Parallel Trends Test

Let Time denote q-th quarter since the beginning of time horizon. For  $Post_t = 0$ , we run the following regression:

$$Delay_{it} = \alpha + \beta_0 Treat_i + \beta_1 (Treat_i \times Time) + \beta_2 X_i + \mu_t + \theta_{firm} + \lambda_{task} + \epsilon_{it}$$

The coefficient of interest is  $\beta_1$ . If this is significant, we would find evidence of a linear time trend before quickpay implementation – violating the parallel trends assumption.

Table 1: Linear Time Trend Before QuickPay

	Dependent variable:
	$Delay_{it}$ (in days)
$Treat_i$	-1.10
	(2.98)
$Treat_i \times Time$	-0.01
	(0.49)
Fixed effects	Firm, Task, and Year-Quarter
Controls	Budget, Duration, Bids
Observations	74,677
$\mathbb{R}^2$	0.14
Adjusted R <sup>2</sup>	0.03
Note:	*p<0.1; **p<0.05; ***p<0.01

Each observation is a project-quarter. SEs are robust and clustered at the project level. Observations are for quarters before quickpay.

# 4 Baseline Regressions

$$Delay_{it} = \alpha + \beta_0 Treat_i + \beta_1 Post_t + \beta_2 (Treat_i \times Post_t) + \epsilon_{it}$$

$$Delay_{it} = \alpha + \beta_0 Treat_i + \beta_1 Post_t + \beta_2 (Treat_i \times Post_t)$$

$$+ X_i + (Post_t \times X_i) + \mu_t + \theta_{firm} + \lambda_{task} + \epsilon_{it}$$

Table 2: Quickpay 2009-2011

		$Delay_{ii}$	t (in days)
	(1)	(2)	(3)
$Treat_i$	$-6.19^{***}$	-3.58**	$-3.09^{*}$
		(1.55)	(1.59)
$Post_t$	13.04***		
	(0.52)		
$Treat_i \times Post_t$	3.35***	6.88***	6.83***
	(0.73)	(0.91)	(0.92)
Constant	33.00***		
	(0.36)		
Year-Quarter Fixed Effects	No	Yes	Yes
Firm Fixed Effects	No	Yes	Yes
Task Fixed Effects	No	No	Yes
Duration, Budget, Bids	No	Yes	Yes
$Post_t \times \text{(Duration, Budget, Bids)}$	No	Yes	Yes
Observations	173,900	155,638	155,638
$\mathbb{R}^2$	0.01	0.11	0.12
Adjusted R <sup>2</sup>	0.01	0.05	0.05

\*p<0.1; \*\*p<0.05; \*\*\*p<0.01

Each observation is a project-quarter.

SEs are robust and clustered at the project level.

# 5 Impact of Firm's Financial Constraints

## 5.1 Contract Financing

$$CF_i = \begin{cases} 1, & \text{if project } i \text{ receives contract financing} \\ 0, & \text{otherwise} \end{cases}$$

$$\begin{aligned} Delay_{it} = & \alpha + \beta_0 Treat_i + \beta_1 Post_t + \beta_2 (Treat_i \times Post_t) \\ + & \beta_3 CF_i + \beta_4 (CF_i \times Post_t) + \beta_5 (Treat_i \times Post_t \times CF_i) \\ + & X_i + (Post_t \times X_i) + \mu_t + \theta_{firm} + \lambda_{task} + \epsilon_{it} \end{aligned}$$

Table 3: Effect of Contract Financing: Quickpay 2009-2011

		De	$lay_{it}$ (in da	ys)

Note:

\*p<0.1; \*\*p<0.05; \*\*\*p<0.01

Each observation is a project-quarter.

SEs are robust and clustered at the project level.

Sample restricted to projects active both before and after Quickpay.

#### 8 Firm's rank order

- Consider a project i of firm f in quarter t.
- Let  $\Pi_{f,2010}$  denote all projects of firm f in Fiscal Year 2010.
- Define  $\rho_f = \sum_{i \in \Pi_{f,2010}} (Treat_i \times FAO_{if})/Sales_{f,2010}$ .  $\rho_f$  is the fraction of revenue a firm earned from small government projects in Fiscal Year 2010.
- Let  $Rank_f = r(\rho_f)/N$  where  $r(\rho_f)$  is the rank statistic of  $\rho_f$  and N = number of firms. For example,  $r(\rho_f) = 1 \text{ if } \rho_f = \min(\rho_1, \rho_2, \dots, \rho_N).$
- Put simply,  $Rank_f$  is a firm's rank order based on the fraction of revenue it earned from small government projects in FY 2010.

### 8.1 Portfolio Effects: Discrete

- See Jie's notes for details.
- Assumption: Parallel trends between small projects of firms in different terciles with pooled sample large projects. May not hold. Need to include firm specific control or at least plot the trends.
- Let  $Rank_f^{(k)}$  be an indicator for firm being in the k-th tercile of Rank. Define:
  - $Medium_i = Treat_i * Rank_f^{(2)}$
  - $\textit{ High}_i = Treat_i * Rank_f^{(3)}$

### 8.2 Portfolio Effects: Continuous

- See Jie's notes for details.
- Define  $\theta_i = Treat_i * Rank_f$

$$Delay_{it} = \beta_0 + \beta_1 Treat_i + \beta_2 \theta_i + \beta_3 \theta_i^2 + \beta_4 Post_t + \beta_5 (Treat_i \times Post_t) + \beta_6 (\theta_i \times Post_t) + \beta_7 (\theta_i^2 \times Post_t) + \epsilon_{it}$$

### 9 Firm's rank order: Alternate model

### 9.1 Continuous model

• We have  $\theta_{if} = Treat_i * Rank_f$ 

$$Delay_{ift} = \beta_0 + \beta_1 \theta_{if} + \beta_2 (\theta_{if} \times Post_t) + \beta_3 Post_t + \beta_4 Rank_f + \epsilon_{ift}$$

- Consider a firm with  $Rank_f = k$ . Then, we have
  - Large + Before =  $\beta_0 + \beta_4 k$
  - Large + After =  $\beta_0 + \beta_3 + \beta_4 k$
  - Small + Before =  $\beta_0 + \beta_1 k + \beta_4 k$
  - Small + After =  $\beta_0 + \beta_1 k + \beta_2 k + \beta_3 + \beta_4 k$
  - Treatment effect:  $\beta_2 k$

### Interpretation:

- Treatment effect is  $\beta_2 k$  for a firm that received a proportion k of its revenue from small projects.
- In other words, for a firm earning k proportion of revenue from small projects, Quickpay increased delays on small projects by  $\beta_3 k$  days.

**Assumption:** Parallel trends between large and small projects of the same firm.

Table 12: Continuous Portfolio Effects: Quickpay 2009-2011

Note:

\*p<0.1; \*\*p<0.05; \*\*\*p<0.01

Each observation is a project-quarter.

#### 9.2 Continuous Quadratic Model

• We have  $\theta_{if} = Treat_i * Rank_f$ 

$$Delay_{ift} = \beta_0 + \beta_1 \theta_{if} + \beta_2 \theta_{if}^2 + \beta_3 (\theta_{if} \times Post_t) + \beta_4 (\theta_{if}^2 \times Post_t) + \beta_5 Post_t + \beta_6 Rank_f + \epsilon_{ift}$$

- Consider a firm with  $Rank_f = k$ . Then, we have
  - Large + Before =  $\beta_0 + \beta_6 k$
  - Large + After =  $\beta_0 + \beta_5 + \beta_6 k$

  - Small + Before =  $\beta_0 + \beta_1 k + \beta_2 k^2 + \beta_6 k$  Small + After =  $\beta_0 + \beta_1 k + \beta_2 k^2 + \beta_3 k + \beta_4 k^2 + \beta_5 + \beta_6 k$  Treatment effect:  $\beta_3 k + \beta_4 k^2$

**Interpretation:** \* One unit increase in rank k increases treatment effect by  $\beta_3 + 2k\beta_4$ .

Assumption: Parallel trends between large and small projects of the same firm.

Table 13: Continuous Portfolio Effects: Quickpay 2009-2011

Each observation is a project-quarter.

### 9.3 Discrete Model

- Let  $Rank_f^{(k)}$  be an indicator for firm being in the k-th tercile of Rank. Define:
  - $Medium_{if} = Treat_i * Rank_f^{(2)}$  and
  - $High_{if} = Treat_i * Rank_f^{(3)}$

$$Delay_{ift} = \beta_0 + \beta_1 Low_{if} + \beta_2 Medium_{if} + \beta_3 High_{if} +$$

$$\beta_4 Rank_f^{(2)} + \beta_5 Rank_f^{(3)} + \beta_6 Post_t +$$

$$\beta_7 (Low_{if} \times Post_t) + \beta_8 (Medium_{if} \times Post_t) + \beta_9 (High_{if} \times Post_t) + \epsilon_{ift}$$

- Firms in lowest tercile:
  - Large + before =  $\beta_0$
  - Large + after =  $\beta_0 + \beta_6$
  - Small + before =  $\beta_0 + \beta_1$
  - Small + after =  $\beta_0 + \beta_1 + \beta_6 + \beta_7$
  - Treatment effect =  $\beta_7$
- Firms in medium tercile:
  - Large + before =  $\beta_0 + \beta_4$
  - Large + after =  $\beta_0 + \beta_4 + \beta_6$
  - Small + before =  $\beta_0 + \beta_2 + \beta_4$
  - Small + after =  $\beta_0 + \beta_2 + \beta_4 + \beta_6 + \beta_8$
  - Treatment effect =  $\beta_8$
- Firms in highest tercile:
  - Large + before =  $\beta_0 + \beta_5$
  - Large + after =  $\beta_0 + \beta_5 + \beta_6$
  - Small + before =  $\beta_0 + \beta_3 + \beta_5$
  - Small + after =  $\beta_0 + \beta_3 + \beta_5 + \beta_6 + \beta_9$
  - Treatment effect =  $\beta_9$

Assumption: Parallel trends between large and small projects of firms in the same tercile.

SEs are robust and clustered at the project level.

# 10 Other Proxies for Treatment intensity or Portfolio effects

## 10.1 Proxy 1: Revenue from small projects

• We defined  $\rho_f$  as the share of revenue a firm received from small projects in fiscal year 2010.

- The numerator of  $\rho_f$  is the sum of all federal obligations from small projects of a firm in fiscal year 2010. Because obligations can be negative, the sum can be zero or negative even if the firm held substantial number of small projects.
- In the previous section, we ranked the values of  $\rho_f$ . But this makes interpretation somewhat tricky. The minimum rank for each firm is now 1/N and it is never zero. What does a unit increase in Rank mean?
- An alternative can be to simply scale the values of  $\rho_f$  to between 0 and 1. That is, for a firm A, we define  $Share_A = (\rho_A - \min(\rho_f))/(\max(\rho_f) - \min(\rho_f)).$ 
  - Suppose  $\rho_A = -1, \max(\rho_f) = 3, \min(\rho_f) = -2$ . Then,  $Share_A = (-1 (-2))/(3 (-2)) = 1/5$ .
  - The max share will be 1 and min share will be 0.
- Setting aside measurement issues described earlier, we have:
  - $Share_f = 0$  represents a firm getting no revenue from small projects.
  - $-Share_f = 1$  represents a firm getting its entire revenue from small projects.

#### 10.2 Proxy 2: Ratio of small projects

- For firm f, define  $Share_f = \frac{\text{Num of small projects in FY 2010}}{\text{Total num of projects in FY 2010}}$  Same analysis as before but advantages:
- - Sample size: only firms excluded are new entrants to government projects.
  - No measurement problem. Share f will be zero for firms with no small projects, and one for firms with only small projects.
  - We can control for differences across firms through fixed effects. This will be less of an issue here because we will have enough observations.
